

- Our priority when repairing/adjusting pumping devices and motors is the most considerate environment approach possible.
- Primarily, it concerns the use of special lubricants falling under the SKF production for the food industry (LCF2-SKF) which fulfill all current legislative requirements. Furthermore, for the environmental protection, we use oils from BP of the highest quality.
- Among our commonplace activities belong the waste separation and the qualified treatment of used oils, contaminated parts and other environmentally unsound waste.
- The disposal of contaminated cleaning agents, polluted oils and waste is contracted with a specialized company.
- To the section of environmental protection belongs also the conversion of cooled mechanical seals from the full flow ones (water-cooled) to seals with own cooling circuit – see the special offer.
- The use of this system is accompanied with a substantial saving of cooling water, which has a friendlier environmental impact.
- Another considerable contribution to a healthier environment is our activity of pumping-device precision designing during which unnecessary energy consumption is avoided. Energy-saving pumping-devices can be purchased in our specialized store.
- Even the perfect bearing diagnosis, timely exchange of mechanical sealings and preventive cleaning of hydraulic parts of pumps and their motors is a significant contributor to the environmental protection.
